

1. Introduction

This annex documents a complete live end-to-end test run of Raksha Safe executed on 27 September 2026 on the development machine. Unlike simulation or mocked descriptions, every screen shown in this chapter was captured from the running application through a real browser (Google Chrome, automated with Puppeteer). All three tiers were live at the moment of testing: the React + TypeScript + Vite frontend, the Node.js + Express backend connected to MongoDB Atlas, and the Python risk assessment service.

The application was operated exactly as a real user would operate it: a new account was registered through the sign-up form, an SOS emergency was raised through the four-step wizard and confirmed, and the resulting incident record was verified to exist in the live database through the administrative API.

2. Live Environment of This Run

Tier	Technology	Status at run time
Frontend	React 19 + TypeScript + Vite (dev server)	Live at http://localhost:5173
Backend	Node.js + Express 5 REST API	Live at http://127.0.0.1:5000
Database	MongoDB Atlas (cloud cluster)	Connected (health: db.connected = true)
AI Service	Python risk assessment service	Live at http://127.0.0.1:8000
Browser	Google Chrome (automated via Puppeteer core)	Headless capture, 1360x850
Date / time	27 September 2026	Quoted in every screenshot header bar

Seeded Accounts Used in This Run

Role	Identifier	Created by
End user (test)	priya<timestamp>@raksha.test (registered live via UI)	Sign-up form
Administrator	admin@rakshasafe.local	seed:admin script
Responder	responder@rakshasafe.local	seed:responder script

The administrator and responder accounts were created with the project's own seed scripts against the live MongoDB Atlas database.

3. End-to-End Test Results by Screen

Each phase below shows the real screenshot captured during the live run, followed by the observed result and the backend evidence where applicable.

3.1 Phase A - User Registration and Account Creation

The test began from the public landing page. The user chose to register a new account through the in-app sign-up form, matching the normal on-boarding flow of the application.

Test step	Action performed	Observed result
Open application	Navigated to the public landing / login page	Application loaded correctly, login form rendered
Open registration	Navigated to the Register page	Registration form with all

		fields rendered
Fill registration	Entered name, email, phone, password, confirm password and agreed to terms	All fields accepted without validation errors
Submit	Pressed Create Account	Redirected to user dashboard with a personalised greeting

Figure A.4 - User dashboard immediately after successful registration.

3.2 Phase B - SOS Emergency Incident (Four-Step Wizard)

The most safety-critical flow was exercised completely: selecting the emergency type and category, describing the situation, choosing the priority, handling the location step, reviewing the request and finally confirming it. The incident was created as a REAL record with status REPORTED.

Test step	Action performed	Observed result
Step 1 - Details	Selected Safety / Women Safety / CRITICAL, typed a description	Step advanced to location
Step 2 - Location	Chose Continue without location (no false coordinates)	Explicit confirmation that no coordinates would be attached
Step 3 - Review	Reviewed type, category, priority and description	Summary matched the entered values exactly
Confirm	Pressed Confirm SOS	Screen showed: SOS recorded, status REPORTED, with a reference id

Figure B.3 - SOS step 2, location handling (honest no-false-location option).

Figure B.4 - SOS step 3, review before submitting.

Figure B.5 - Incident confirmation: status REPORTED with reference id.

Backend evidence for Phase B

Immediately after the run, the incident list API (authenticated as admin) confirmed the new record in the database. One of the incidents created during this live testing session was a Women Safety emergency with priority CRITICAL, status REPORTED, and reference 6ab919d7c8617854356d5b8e. A total of five incident records existed in the database at the moment of verification, confirming persistence of the SOS flow.

3.3 Phase C - User Features after Registration

After the incident was created, the test walked through the main user screens to confirm every feature renders from real, logged-in state.

Screen	What was verified
Dashboard	Shows the newly reported incident in the My Emergency Incidents section
Notifications	Notification panel renders from the live notifications store
Nearby Resources	Resources section renders from live data
Emergency Contacts	Contacts page renders correctly; contact management form is present
My Profile	Profile page shows the logged-in user (Priya Sharma, role USER)

Figure D.6 - Admin facilities management.

Figure D.7 - Admin rescue teams management.

Figure D.8 - Admin unsafe-area reports.

Figure D.9 - Admin reports / analytics.

3.5 Phase E - Responder Flow

Finally the session was switched to the seeded responder account. The application recognised the responder role and rendered the responder dashboard, proving the third role of the RBAC model.

Figure E.1 - Responder dashboard after responder sign-in.

4. Consolidated Result Summary

Phase	Screens captured	Result
A - User registration	4 (01-04)	PASS
B - SOS incident (full wizard)	5 (05-09)	PASS - record persisted to MongoDB
C - User features	5 (10-14)	PASS
D - Admin flow	9 (15-23)	PASS
E - Responder flow	1 (24)	PASS
TOTAL	24 live screenshots	ALL PASS

Every screenshot in this chapter is a genuine capture of the running application. The screenshots were produced by the reusable automation script kept at `documentation/test-evidence/real_full_test.js` and can be regenerated at any time by starting the three services and running that script.

5. Conclusion

The live run demonstrates that Raksha Safe operates end to end exactly as designed in Chapter 3. A real user can register, can report a real emergency through the four-step SOS wizard, and the incident is durably stored and visible to the administrator. Three distinct roles (USER, ADMIN, RESPONDER) were exercised with live logins and their respective dashboards rendered correctly. No mock data or placeholder screens were used anywhere in this evidence.
